

ENCANVAS®

COMPANY

About Encanvas Inc.

Enterprise information management

- Extends collaboration and processes beyond the boundaries of the enterprise
- Sets new standards in data security and IP governance
- Democratizes IT
- Boosts knowledge worker productivity
- Increases business agility while reducing IT overheads

Company

- Technology incubation (2002-2005)
- Company established in 2006
- Runner-up in Enterprise Awards 2007 for 'best new technology company'
- Microsoft ISV®
- Privately owned
- Strong R&D team with tight links to customers
- 40% of company dedicated to product development

Regional sales

- Western Europe
- Scandinavia and Eastern Europe
- USA and Canada
- Asia
- Africa

Encanvas is a fast growing business software publisher. We solve information working business challenges with innovative software solutions.

In the beginning

In 2002, the founders of Encanvas set out to solve a common business problem. In this new era of business, people and teams need to collaborate from wherever they are to achieve business outcomes but today they can't access the information or tools they need. To support knowledge working, organizations need to extend their relationships and processes beyond the boundaries of their enterprise – and they need innovative technology to enable this transformation.

Innovation starts by daring to believe in a vision that conflicts with the current reality

The founders of Encanvas shared a vision of how information management should work; *could* work. Thanks to a blend of this clarity of vision and the skills of a remarkable team of technologists, the first components of Encanvas Integrated Software Platform (ISP) were released as 'tools' for consultants to use in 2006. From experience gained through client deployments, the team was able to improve the technology to service bigger and bigger projects. In 2008-2009, the learning of previous years was digested into development of the Encanvas Secure&Live™ Integrated Software Platform we offer today.

What is Encanvas?

Encanvas Secure&Live™ is an **Integrated Software Platform (ISP)**. It employs ready-made applications building blocks to rapidly design portal and mobile applications that can then be easily deployed and operated. Close integration of design elements obviates advanced programming or IT skills whilst retaining the dexterity to meet most business requirements. Encanvas produces a step-change in the economics of business applications software and time-to-market on new software developments.

Encanvas gives CIO's who *breathe business* a game-changing technology to address the 'long-tail' of applications now demanded by stakeholders, delivering greater software value to their business for lower cost. IT analysts embedded into improvement teams can create portal and mobile information services that cascade decision making and performance management through the enterprise. Solutions streamline data capture, provide individuals and teams with the ability to securely share content, formalize processes, digest ideas, track activities, manage and align projects to achieve business outcomes. Customers include Transport for London, Ernst & Young, PA Consulting, Canon Europe and telent Ltd.

Unrivalled enterprise security

Organizations are today unable to protect their intellectual property and sensitive data when networks and processes extend beyond the boundaries of the enterprise. Encanvas sets a new standard in information security and IP governance. It enables IT administrators to manage every aspect of master data management, portal deployment, user identity and access management and data governance no matter how many portals and mobile applications are developed.

Incorporated disciplines

- Portal services
- Identity management
- Integration
- File transfer
- Flow orchestration
- Content management
- Web services
- Agile development
- Data mashups
- Search
- Maps
- Mobility
- Social networking and secure communications
- Data capture and forms
- Printing
- Workflow
- Dynamic data visualization

Created on Microsoft® .NET, deployed on Microsoft® .NET and Microsoft® Azure™

Encanvas has been created using standard Microsoft® technologies and produces business applications designed to work best on Microsoft® operating systems and technology platforms.

Secure, no nonsense software for business that just works (the way you want it to)

With Encanvas, you don't have to invest a fortune on complex IT projects or spend months trying to integrate data across the enterprise with expensive middleware tools. Encanvas software is designed so that you don't need lots of different software applications or special IT coding and scripting skills. Everything you need is in the box!

The fastest way to right-first-time applications

Encanvas delivers right-first-time applications faster than any other system or method but that doesn't mean we compromise on performance or usability. Compare us to established brands and find out why Encanvas is one of the fastest growing business software companies.

Encanvas is a building block system for creating information management environments.

The Encanvas Secure&Live™ portal architecture blends coding and scripting with point-and-click building blocks we call 'Middle-App™' technologies. It means analysts with only basic database knowledge and IT skills can rapidly build new business applications by 'connecting, mashing and configuring' that they don't need to code or script from scratch. Better still, Encanvas Secure&Live™ serves applications directly to the Microsoft® Azure™ cloud or to on-premises web server platforms and makes possible the implementation of a resilient 4-tier inclusive security model. The interlocking principle of our design elements makes Encanvas unique, and offers unlimited applications development possibilities.

About 'Canvases'

Canvases are the technology innovation at the heart of Encanvas Secure&Live™; a light-weight XML structure used bring together the logic of applications and their resources into a single place to ensure coherency in master data management and application lifecycle.

Business social networking

Encanvas includes class-leading social networking and collaboration features out-of-the-box including secure online instant messaging, document and applications presentation across the Web, tag-based content management and high volume secure file transfer.

Version-Rollback™ makes Encanvas applications future-proof

Encanvas creates applications designed to change over time. To make this possible we've invented **Version-Rollback™** technology: Canvases record in their metainformation a description of the version levels of platform tools used to create and deploy them. When canvases are edited, the tools used to edit and publish them 'rollback' to original versions so new features are not initiated unless settings are overridden.

Ready-to-use design elements

Encanvas employs a series of ready-to-use building blocks that can be brought together in different ways to produce new applications. These include components for data capture, business intelligence, reporting, search and discovery, content management, instant messaging and more.

Application Lifecycle Management (ALM)

Encanvas supports the complete application lifecycle from design concept to completion. It includes tools to streamline application orchestration and deployments, the creation of help text and site design.

Scalable solutions

There's no limit to the size and scale of applications Encanvas can produce. View our case studies to find out about large-scale enterprise and industry deployments.

Integrated middle-ware

Encanvas incorporates one of the most advanced data integration layers ever created in an enterprise computing applications development environment. It employs a point-and-click suite of data connectors, a drag-and-drop systemized information flow designer, and a multi-linking capability that blends data from disparate sources to create new data structures. Encanvas is a true multi-threading technology that can engage a series of data sources at the same time.

Solutions and applications

Encanvas has developed a suite of end-user offerings created using the Encanvas Secure&Live™ Integrated Software Platform.
