Encanvas Live® Wireframe™

OVERVIEW

Live Wireframe™ is a Low-Code rapid application development platform. Use it to create better software application prototypes faster than any other method.

Use Live Wireframe™ to create apps across the desk with users and stakeholders in near-real-time. Remove the barriers between IT and the business.

What is it?

Designed for business analysts and citizen developers, Live Wireframe™ is a cloud-ready software toolkit that enables business analysts to create software prototypes faster than any other method. Designers don't need programming skills because the solution is designed for business analysts and citizen developers.

Why use it?

Systems of Record (such as financial, HR and CRM systems) provide only the base back-office functions that every business needs. To create a competitive advantage and support the data processing needed to orchestrate your business model, you'll need a digital platform and ecosystem that can adapt over time.

What to expect

We created Live Wireframe™ to facilitate across-the-desk codeless software design. It means citizen developers, normally business analysts, create apps instead of coders and scripters. It means your business gets better-fit apps, faster.

With encanvas, there's no need to source new software tools or jump into outsourcing every time someone identifies a process can be improved.   Encanvas® Live Wireframe™ displaces SaaS tools and spreadsheets with a joined-up enterprise-grade software platform that's safer for data, easier to scale and adapts as your business grows. Re-engineer internal processes and bring more value customers and suppliers through digital platforms and ecosystems authored using Encanvas Secure&Live.

Encanvas is designed to support business-critical applications. That means everything we do maximizes IT controls over data and the apps you publish.

Benefits:

ADD
• Rapid development of
  app prototypes
• Fail-fast design
• Agile Codeless methods

GROW
• Data security and
  governance controls
• Data value and re-use

REDUCE
• Data integration issues
• Data risk

REMOVE
• Coding and scripting
• Barriers between IT and
  the business
