

# Encanvas® Secure&Live™

## OVERVIEW

Create secure and live workspaces to extend teams and processes beyond the boundaries of your enterprise. Encanvas reduces IT related costs whilst providing business areas with the information and analysis tools they need.

**Use Secure&Live™ to create apps across the enterprise to orchestrate business models and supercharge growth without coding**

### What is it?

Encanvas Secure&Live™ (version 4.0) is an enterprise application software platform that creates and manages rich and engaging applications that securely extend business networks and processes beyond the boundaries of your enterprise. Manage processes and communities inside and outside the organization.

### Why use it?

More than ever, businesses need to share ideas, content and processes with customers, workforce, partners, and suppliers; collaborations that extend beyond the firewall of the enterprise. This virtual, more collaborative world places new demands on IT and requires a step-change when it comes to information systems. Create a digital ecosystem for your digital transformation.

### What to expect

With Encanvas Secure&Live™, businesses create secure and live workspaces and mobile applications for their teams to share applications and content, formalize processes and data governance, digest ideas, track activities - and manage projects and relationships inside and outside the organization.

Our codeless enterprise software application platform is built on Microsoft® Web Platform technologies. It incorporates one of the most advanced data integration layers ever created and employs point-and-click data connectors, a drag-and-drop information flow designer for automating workflows, and a multi-linking capability that re-uses data from disparate sources to create new data structures.

Encanvas is designed to support business-critical applications. That means everything we do maximizes IT controls over data and the apps you publish.

## Benefits:

### ADD

- Rapid development of app prototypes
- Fail-fast design
- Agile Codeless methods

### GROW

- Data security and governance controls
- Data value and re-use

### REDUCE

- Data integration issues
- Data risk

### REMOVE

- Coding and scripting
- Barriers between IT and the business
