

# Digital Documents Remastered

## Secure&Live Enterprise Digital Document aPaaS

ENCANVAS is digital document software. It equips organizations to empower digital workers to maximize their productivity and innovation.

Create secure and live digital document workspaces to extend teams and processes beyond the boundaries of your enterprise. Encanvas reduces IT related costs whilst providing business areas with the information and analysis tools they need.

**Secure&Live™ is our flagship aPaaS. Use it to deploy digital documents across the enterprise to orchestrate processes and supercharge growth.**

### What is it?

Encanvas Secure&Live™ creates and manages rich and engaging digital information management and publishing solutions. It's designed to securely manage information management and processing of communities inside and outside the organization.

### Why use it?

More than ever, businesses need to share ideas, content and processes with customers, workforce, partners, and suppliers; collaborations that extend beyond the firewall of the enterprise. This virtual, more collaborative world places new demands on IT and requires a step-change when it comes to information systems. Create a digital ecosystem for your enterprise to harness digital innovations and take them to the edge of the enterprise.

### What to expect

With Encanvas Secure&Live, digital workers use digital documents to maximize the value of data. It allows teams to turn ideas into digital solutions, share content, formalize processes and data governance, digest ideas, track activities - and manage projects and relationships inside and outside the organization.

Codeless software goes a step further than no-code, and two steps further than low-code to bring a new standard of agility in your business. This is achieved without asking IT leaders to lose control over their digital ecosystem. It resets the balance between IT and the business in favor of both parties.

Our codeless software incorporates an advanced data integration layer. Its data fabric applies codeless multi-linking to make data accessible from disparate sources composable. It employs point-and-click data connectors and software bots for automating workflows. Every feature found in Secure&Live aims to maximize IT controls over data and the digital solutions you publish.

### Benefits:

#### ADD

- Rapid development of software prototypes
- Fail-fast design
- Agile codeless development methods

#### GROW

- Data security and governance controls
- Data value and re-use

#### REDUCE

- Data integration issues
- Data risk

#### REMOVE

- Citizen applications risks and SaaS sprawl
- Coding and scripting
- Barriers between IT and the business
